Homework#6

Date Given: April 10, 2024

Due Date: April 11, 2024

=====

There are 5 problems in this homework assignment. Write a program in Python to solve these problems.

=====

The following Python dictionary is given:

```
temps = {'Mon' : [68, 89], 'Tue' : [71, 93], 'Wed' : [66, 82] , 'Thu' : [75, 97], 'Fri' : [62, 79] }
```

1. Convert the Python dictionary 'temps' into the Python DataFrame named 'temperatures' with 'Low' and 'High' as the indices, then display the DataFrame.

	Mon	Tue	Wed	Thu	Fri
Low	68	71	66	75	62
High	89	93	82	97	79

2. Use the column names to select only the columns for 'Mon' through 'Wed'.

	Mon	Tue	Wed
Low	68	71	66
High	89	93	82

3. Use the row index 'Low' to select only the low temperatures for each day.

Mon	68
Tue	71
Wed	66
Thu	75
Fri	62

4. Set the floating-point precision to 2, then calculate the average temperature for each day.

Mon	78.5
Tue	82.0
Wed	74.0
Thu	86.0
Fri	70.5

5. Calculate the average low and high temperatures.

Low	68.4
High	88.0
